PRACTICAL # 6 in PLATFORM TECHNOLOGY – Azure Automation

Submitted by:

John Benedict D. Esperas

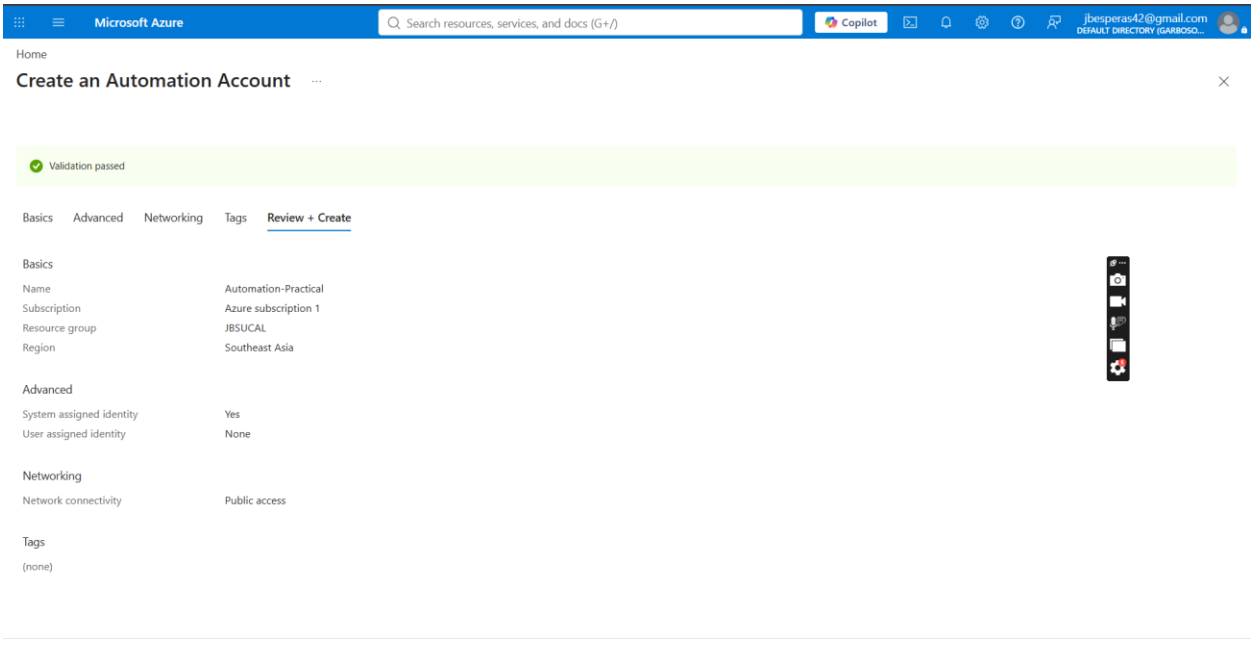

BSIT – 41

Submitted to:

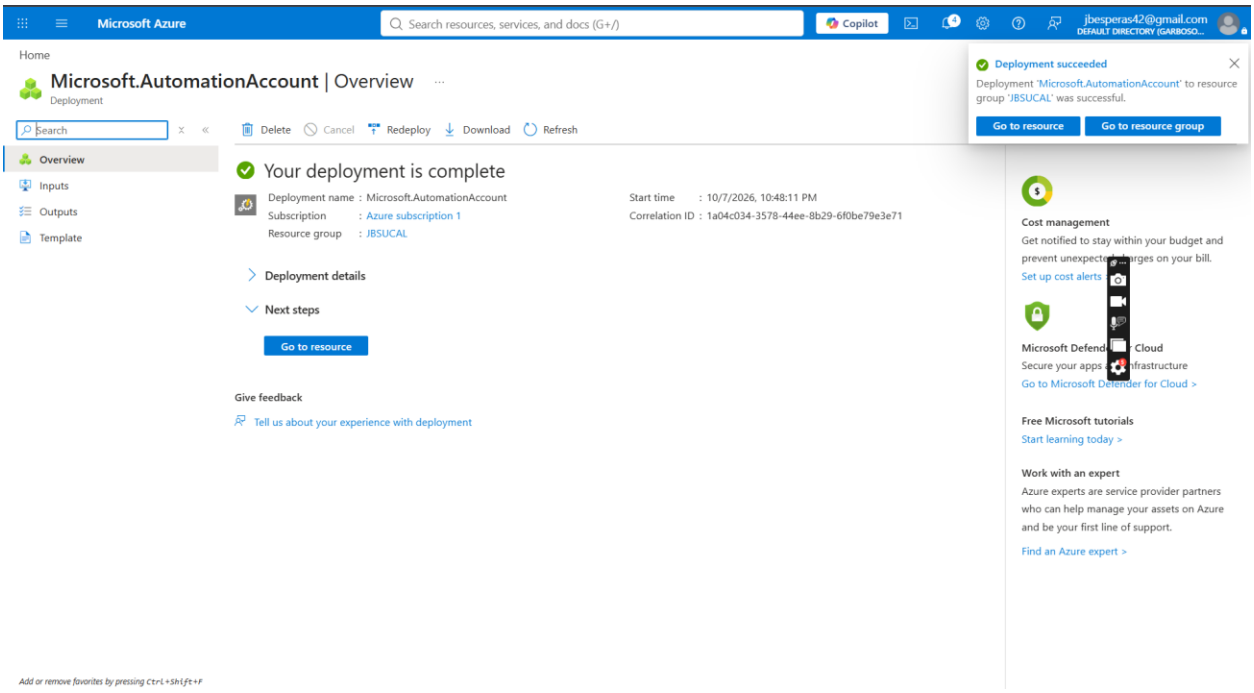

Prof. Truly Enriquez

October 08, 2026

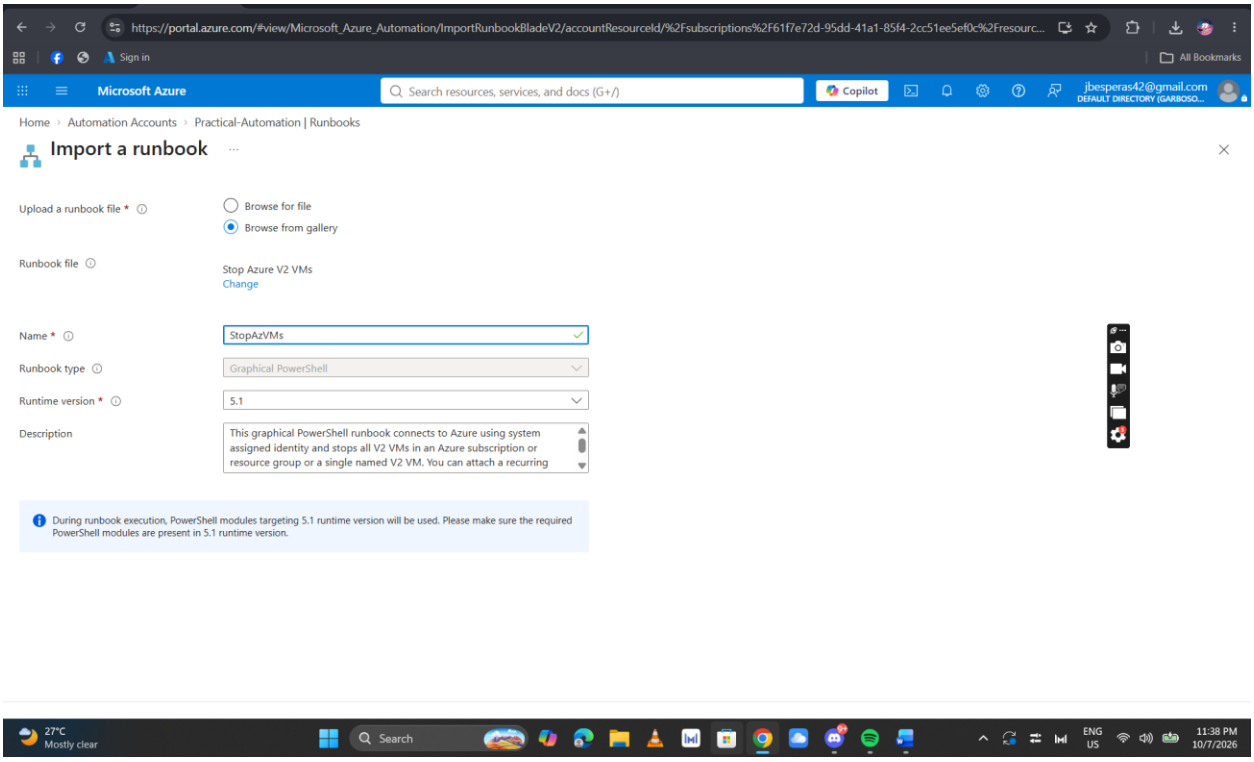

Creating an Automation Account: I created the **Practical-Automation** account in Azure for the practical activity, and was used to set up the automation needed for managing the virtual machine.

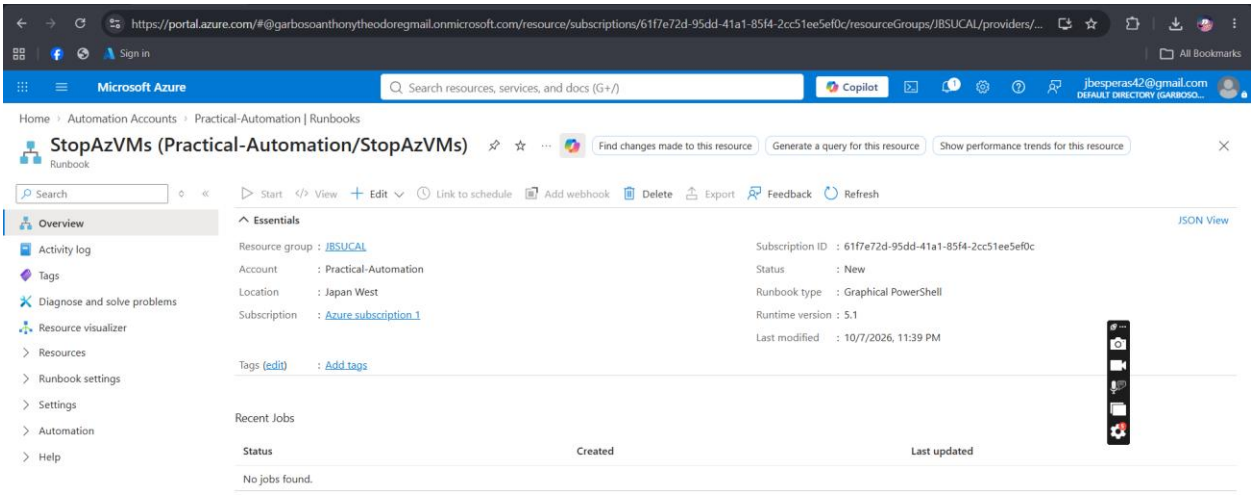

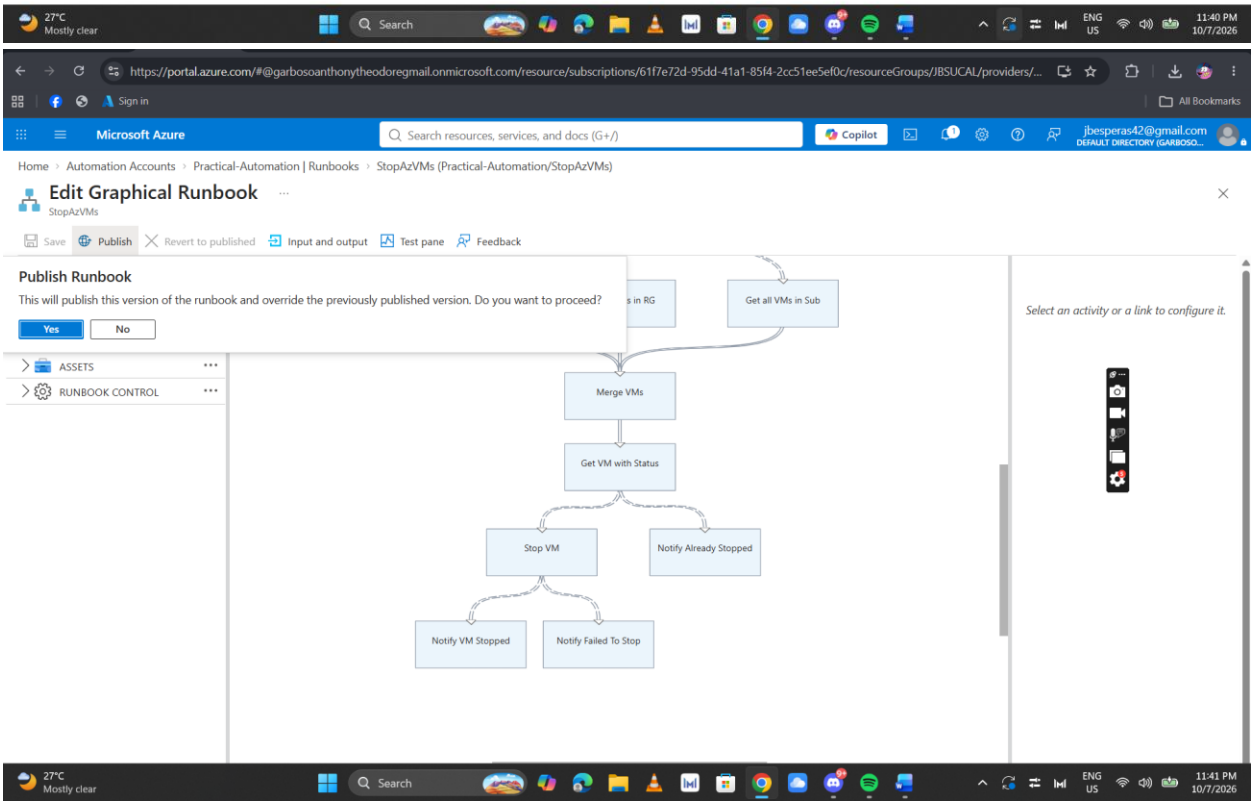

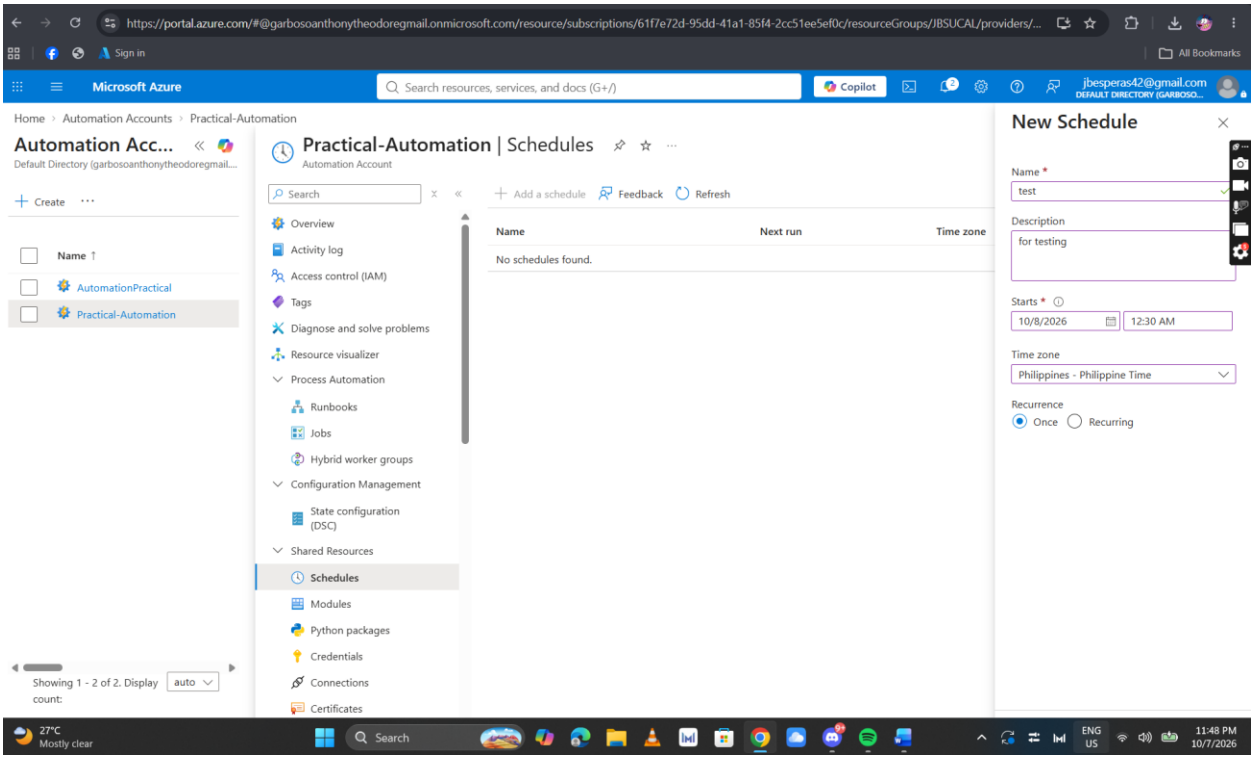

Import a runbook: I imported the **StopAzVMs** runbook into the Automation Account. I configured it to work with the **EsperasServer** virtual machine and the assigned subscription. After importing, I edit it using portal and published it.

Adding a Schedules: I added a schedule for the **StopAzVMs** runbook to determine when the automation would run. This allows the virtual machine to be managed automatically based on the schedule.

Output: I encountered some problems while executing it. Since I was creating this practical using a Contributor role, the VM did not shut down on time, but after fixing the permissions and adding the required role, I successfully executed the runbook and stopped the VM.

Reflection:

This practical activity helped me to understand how azure automation can be used to manage a virtual machine without manually performing the task every time. I also learned how to create an automation account, import a runbook, and add a schedule to automate the process. I also encountered permission issues while trying to run the automation, which helped me understand that the automation account's managed identity needs the proper access to the subscription and virtual machine. Overall, the activity gave me a better understanding of how automation and permissions work together in azure.
