Creating a Resource group: It holds down all azure resources in one place so its easy for me to manage or delete them for later.

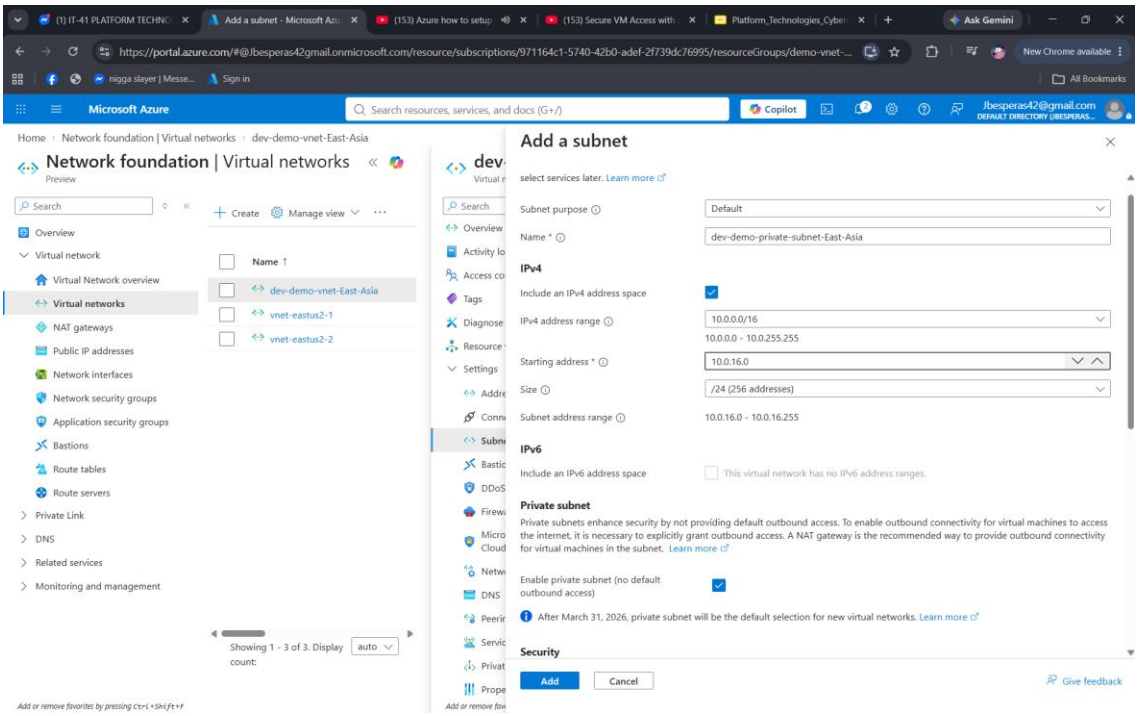

Configuring the Vnet: I created a virtual network (VNet) named dev-demo-vnet-East-Asia with the address space 10.0.0.0/16, I also deleted the default because I will set it up later.

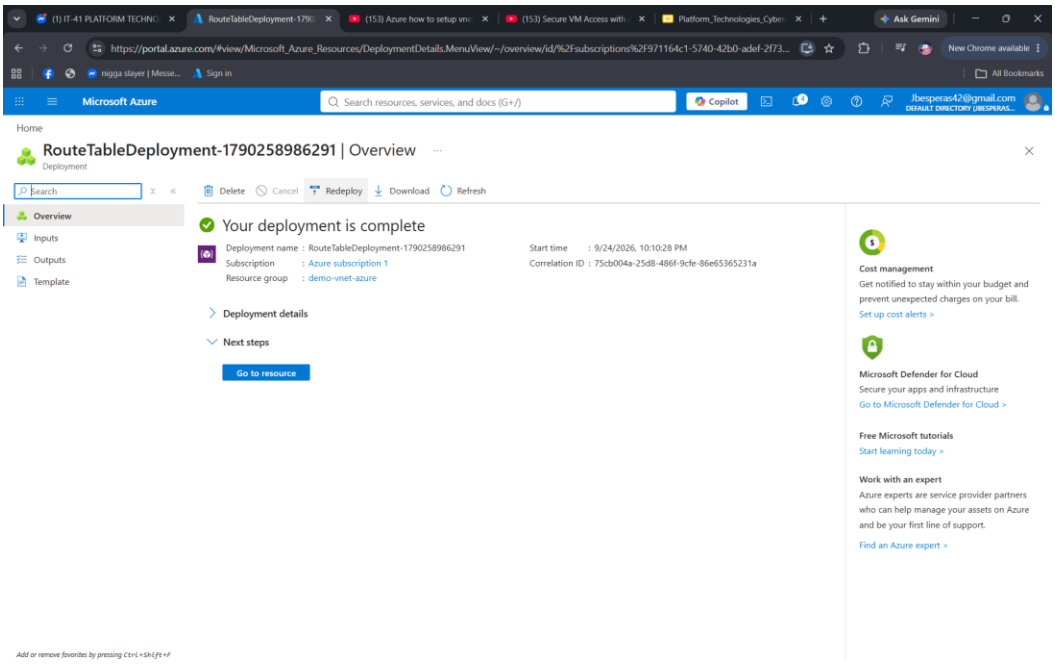

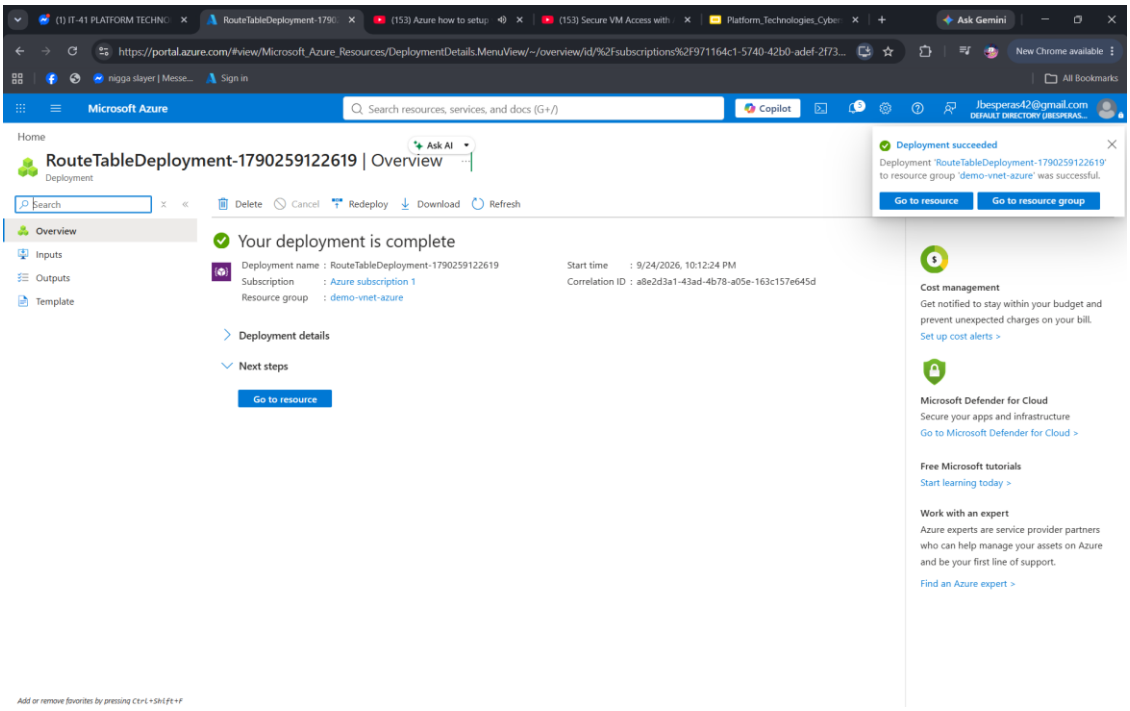

Creating the subnets for Public and Private: I have used the given Ip which is 10.0.15.0 for the PUBLIC IP while 10.0.16.0 for the PRIVATE IP, so each subnet has its own range and don't overlap with each other.

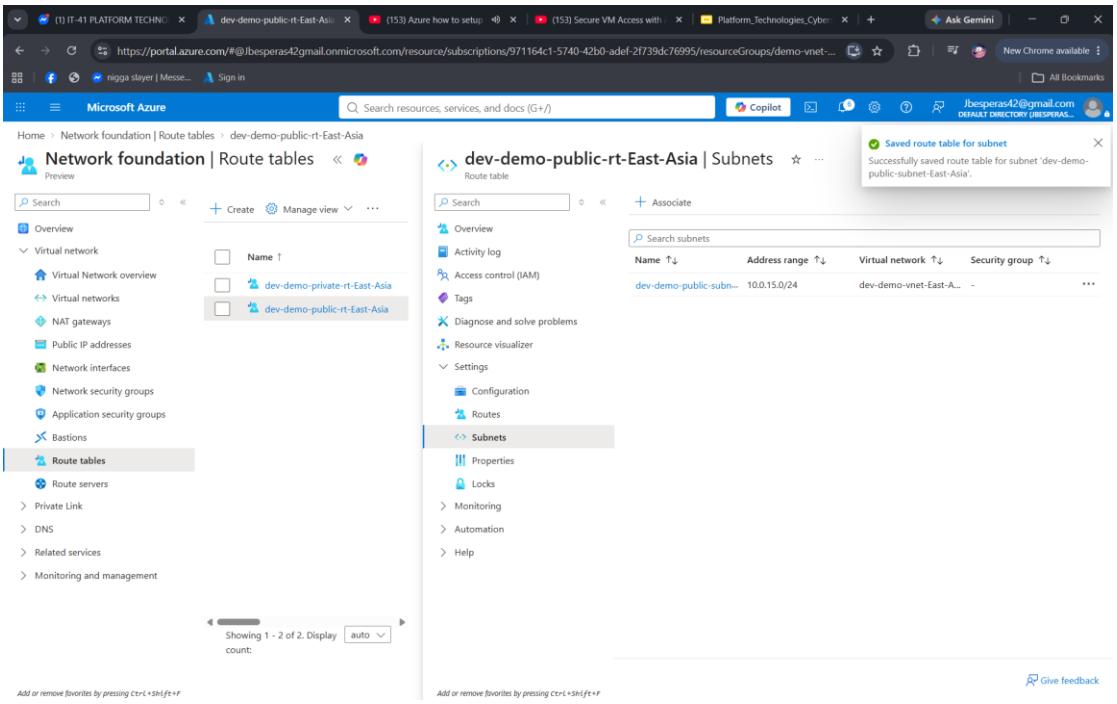

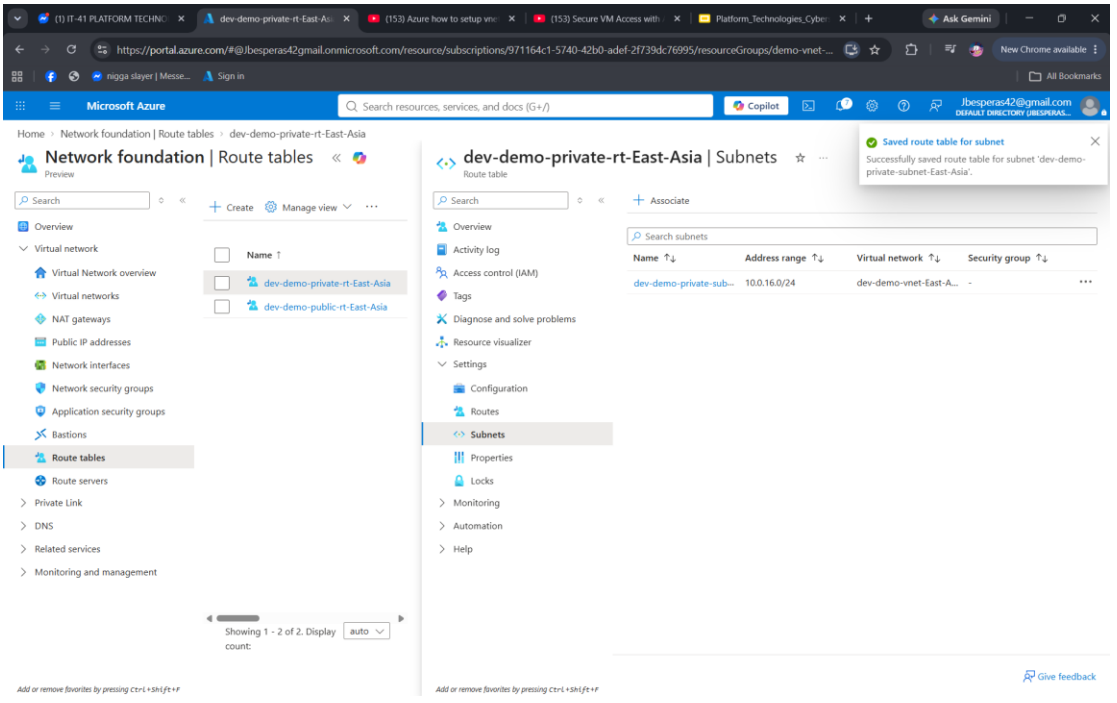

Creating a Route Table: I created two route tables, dev-demo-public-rt-East-Asia and dev-demo-private-rt-East-Asia. A route table decides where network traffic will be sent from the subnet. The firs screenshot is the public, while the second screenshot shows that the private route table deployment completed.

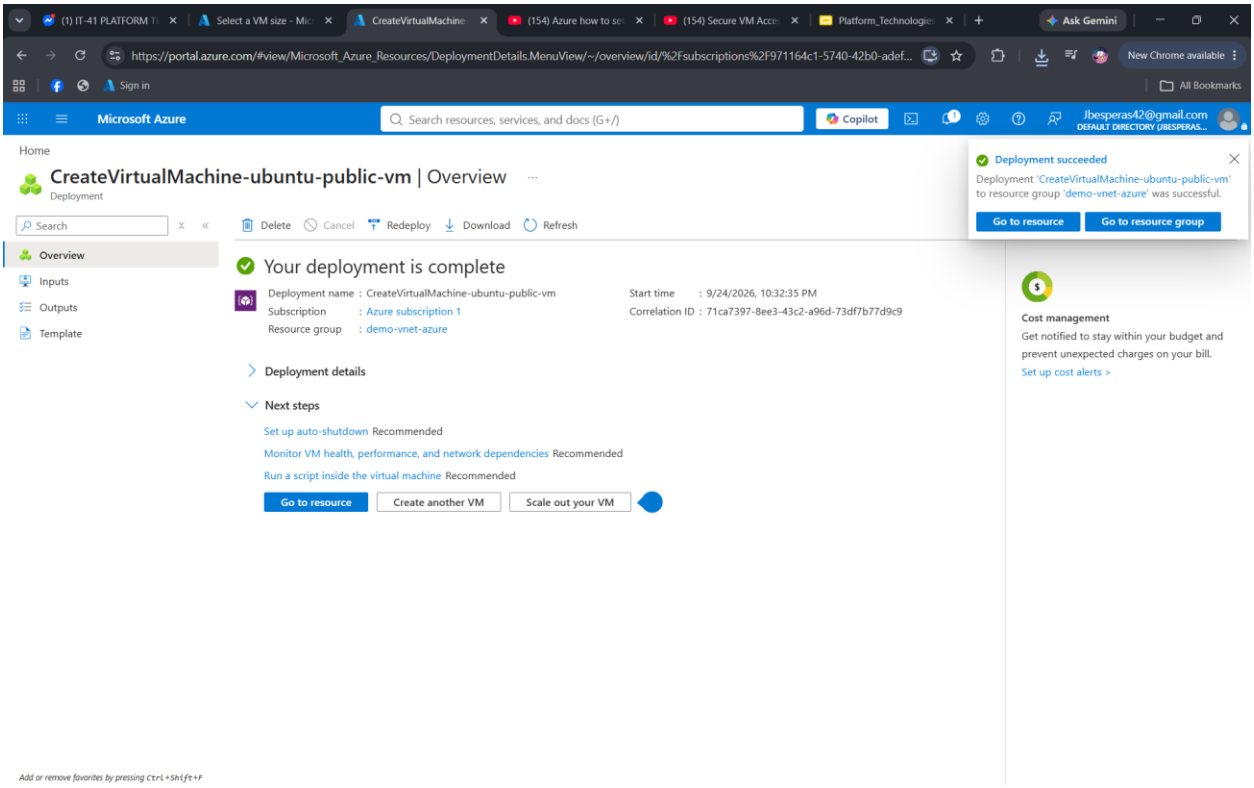

Associating the Route Tables:

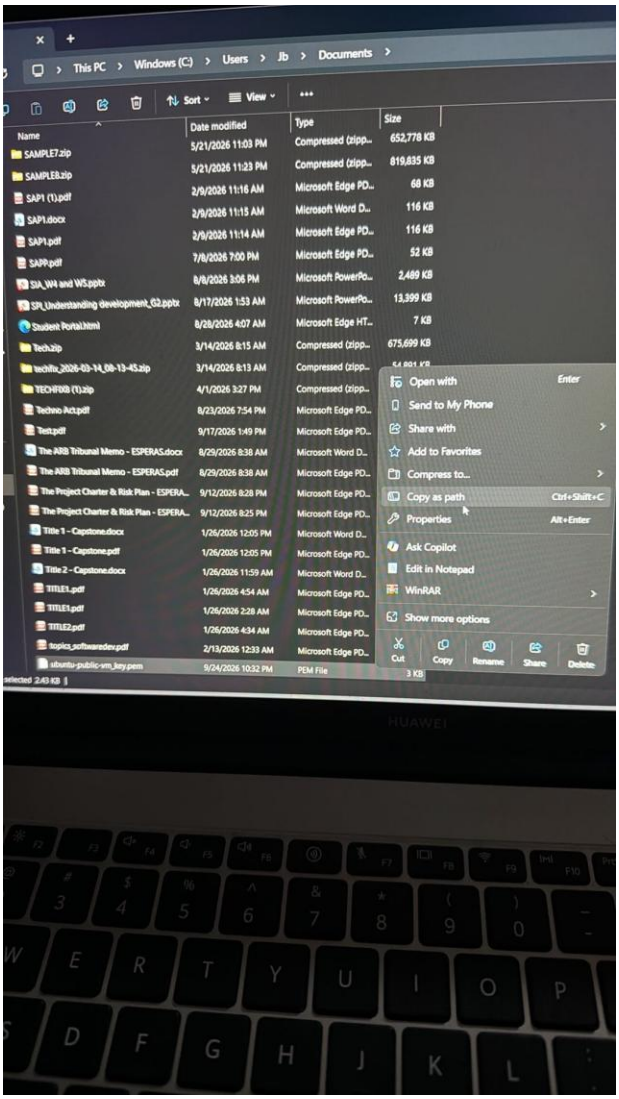

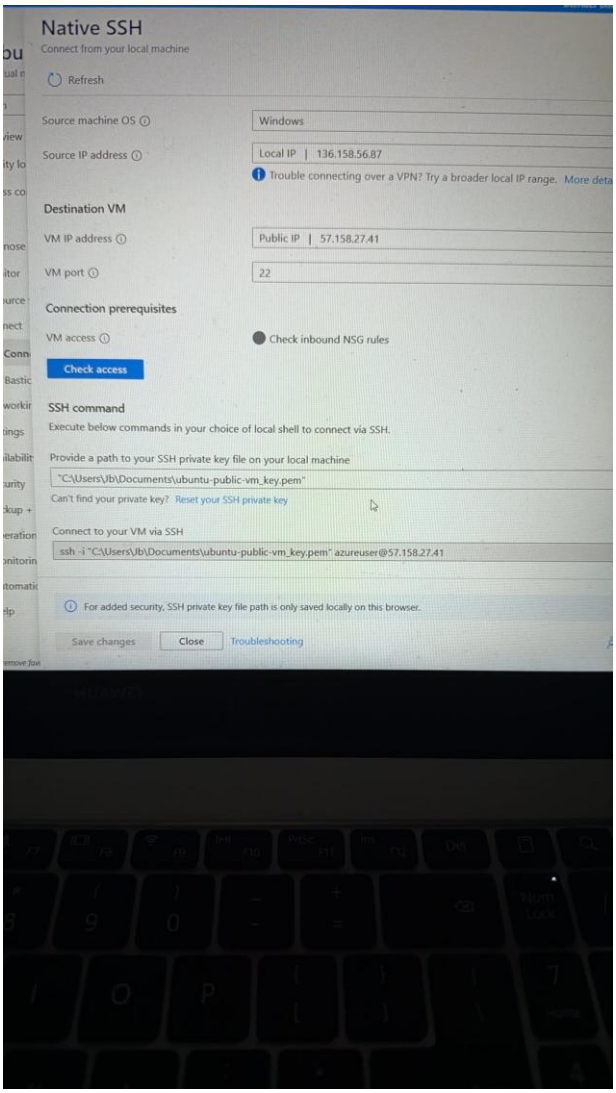

Creating a VM: I have created a new VM using ubuntu for the image, I do encountered some technical difficulties on the image size, because my subscription is not letting me choose the standard B option, but I request a quota and got accepted.

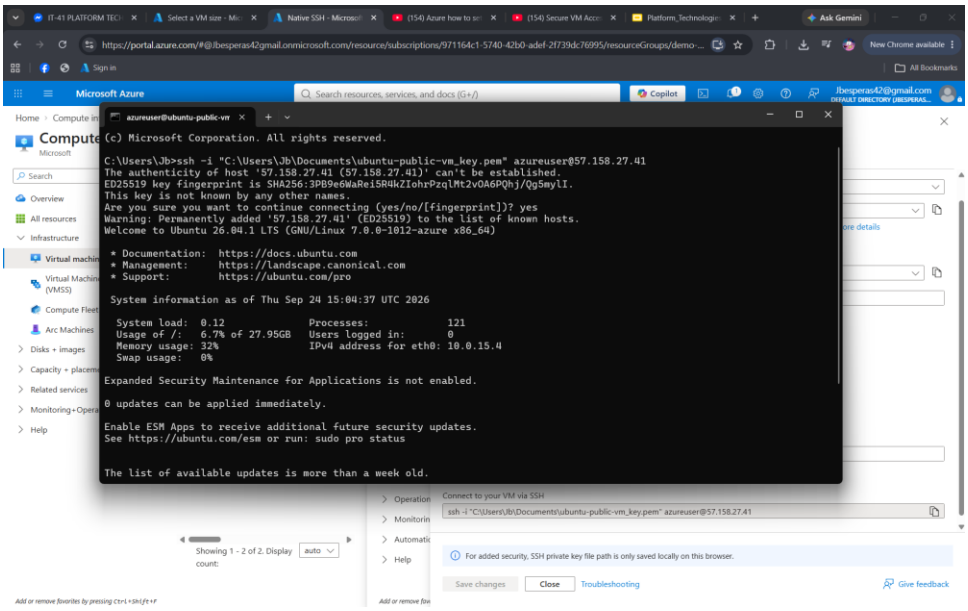

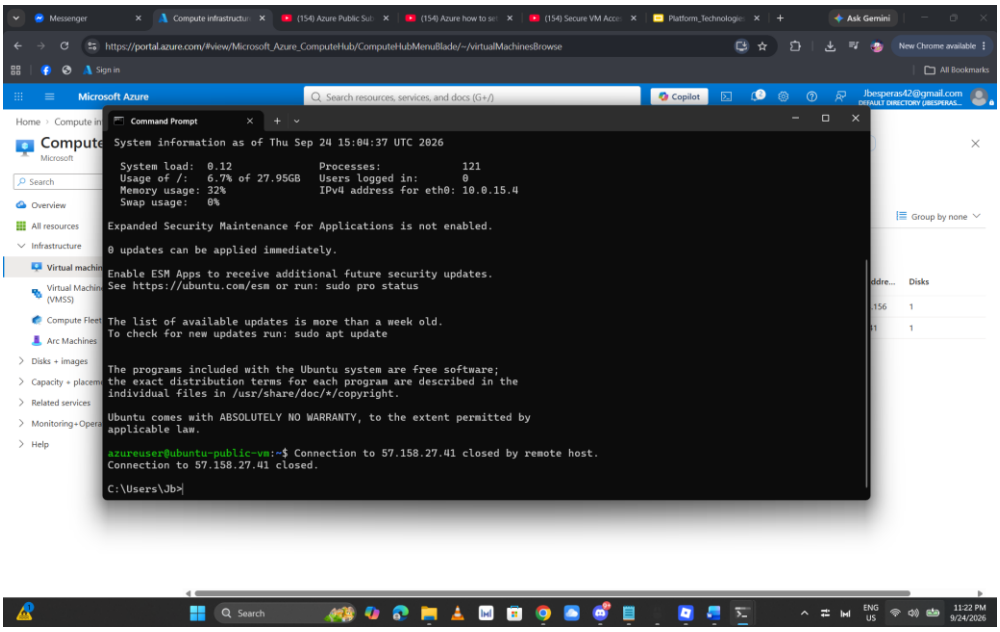

Copy the Path of the File: I copied the path file of the given document after I created the VM, and after copying the path, I pasted it on the PATH then connect it.

Output: I copied the given SSH Command in Azure and pasted it on my CMD, it shows the IP that I've input at the first part of the step showing that I'm connected to the VM through SSH.

Reflection:

It’s been a challenge, because I was stuck at the SSH path file. I seek help from my classmates and learn from it. The video that I watched was using a different CLI and didn’t show the part where he copied the path of the downloaded file and pasted it into the PATH FILE in azure. I learned how Route table works, how to create a subnet and VNet inside azure, and how to humble yourself when you don’t know what to on the next step.
